59th Herefords Australia National Show and Sale

Proudly Presented by **MULTIMIN[®]**
EVOLUTION

Wodonga Exhibition Centre, Wodonga, Victoria

Wednesday 15th May 2024

9am – Show

Judge: Shane Bedwell, American Hereford Association,
Kansas City, MO

Thursday 16th May 2024

9am – Sale

Open cry auction interfaced with AuctionsPlus

Tuesday 14th May 2024

10am - 3:30pm **Hereford Australia Breed Forum**

3:45pm **Vendors Meeting**

4:30pm **Herefords Australia AGM**

6pm **Hereford Australia Happy Hour**

Members Bar, Wodonga Racing Club

Wednesday 15th May 2024

6.30pm **Event Dinner**

Huon Hill Wodonga

93 Poll Hereford and 48 Hereford Bulls

subject to withdrawals

TERMS AND CONDITIONS OF SALE

Terms and conditions of this sale will be displayed in the sale complex.

If you have any queries, please contact the selling Agents.

2% rebate allowed to outside Agents introducing buyers and settling within seven (7) days.

THIS SALE WILL BE CONDUCTED BY

Ross Milne: 0408 057 558
Ryan Bajada 0435 411 536

MULTIMIN®

WHEN IT MATTERS

IMPROVED FIRST CYCLE CONCEPTION RATE

Multimin Evolution has been shown to improve the first cycle conception rate by **UP TO 19.4%**.¹⁻³ Conception in the first cycle can lead to an additional 20 to 40 days for calves to grow.

IMPROVED PREGNANCY RATES

Pregnancy rates in breeding females treated with Multimin Evolution are up to **12% HIGHER** than untreated females, depending on the length of the breeding season and breeding method.^{1,2,4-6}

IMPROVED SPERM QUALITY

Bulls treated with Multimin Evolution 90 days before joining had **22% HIGHER** sperm concentration and significantly more motile sperm than control animals.⁷⁻¹⁰

QUALITY ASSURANCE

All bulls offered for sale in this catalogue have passed the following Quality Assurance measures:

- Independent Vet Inspection for structural & reproductive soundness.
- Semen Test to meet Australian Cattle Veterinarians Standard for natural service. Test results are available for inspection from the vendors or the Duty Agent.
- Tested PI negative.
- Vendors Guarantee.
- All bulls catalogued have been sire verified using DNA
- Have been tested free from Dilutor (DL), Hypotrichosis (HY), Idiopathic Epilepsy (IE), Maple Syrup Urine Disease (MSUD) and Mandibulofacial Dysostosis (MD).
- All bulls have genomic profile improving accuracy of Breedplan EBVs.

Individual buyers of 4 or more bulls will receive a freight rebate of \$100 per bull

VENDOR GUARANTEE

1. Vendors warrant that all bulls are sold as fertile and capable of natural service for a period of 6 months following the date of the sale.
2. Subject to Points 3 & 4, Vendors shall refund to the Purchaser the purchase price paid (less any salvage value) upon the Purchaser providing to the Vendor within 6 months of the sale date:
 - A report from a licensed veterinarian certifying that in his or her opinion:-
 - The bull is infertile or incapable of natural service.
 - There is no evidence that the bull has suffered any injury or illness subsequent to being sold to the Purchaser which could affect its breeding ability.
 - A Statutory Declaration from the Purchaser warranting that in the opinion of the Purchaser the facts stated in the veterinarian's report are true and correct.
3. The Vendor reserves the right to call for an independent veterinary report.
4. In the event of an impasse arising from reports issued pursuant to points 2 & 3, the Herefords Australia National Show & Sale (Wodonga) Management Committee will obtain an independent veterinary report, the findings of which will be final and binding on all parties.

Johne's Beef Assurance Score (J-BAS)

J-BAS is a risk profiling tool developed for use in the new approach to Johne's disease (JD) in beef cattle. The scoring system is from 0 (being 'Unmanaged risk') to 8 ('High Assurance'). Vendors of the Show and Sale are required to have a minimum of a J-BAS 6 in order to exhibit at the event. For more information please go to www.animalhealthaustralia.com.au

It is the responsibility of all potential purchasers to conduct their own due diligence regarding the Johnes disease status of the lots that they are interested in purchasing.

Herefords Australia Ltd and the Herefords Australia National Show and Sale (Wodonga) Management Committee take no responsibility for the J-BAS status of any of the listed herds or cattle.

Supplementary Sheets

Supplementary sheets will be available on sale day with information regarding the following:

- Semen retained – the amount of semen retained in certain bulls
- Raw measurements – taken on Tuesday 14th May 2024

Please Note

Herefords Australia and the Vendors' Committee accept no liability for accidents that occur on Show and Sale days. All persons attending this Show and Sale do so at their own risk.

Whilst all due care and attention has been paid to accuracy in the compilation of this catalogue, neither the Vendors nor the Selling Agents or representative(s) thereof assume any responsibility whatsoever for the correctness, use or interpretation of the information on animals included in this sale catalogue.

Information contained in this catalogue including but not limited to pedigree, DNA information, Estimated Breeding Values (EBVs) and Index values, is based on data supplied by members and/or third parties.

Whilst every effort is made to ensure the accuracy of the information, the ABRI, the Society or Association, their officers and employees assume no responsibility for its content, use or interpretation.

Estimated Breeding Values can only be directly compared to other EBVs calculated in the same analysis.

Raw Measurements For Sale Bulls for Herefords Australia National Show & Sale (Wodonga)

Raw measurements made on animals from different ages and nutritional backgrounds should be treated with caution. These measurements include weight, scrotal size and ultrasound carcass measurements.

Measurements made on individual bulls of different ages with different nutritional backgrounds from conception to final measurement cannot be directly compared. An EBV for an animal predicts the capacity of its progeny. A raw scan is how that animal looks on the day, and this raw data is highly influenced by nutrition and age.

It is best to compare bulls using their Estimated Breeding Values (EBVs), as these measurements have been adjusted for age so that an animal is only ever directly compared with other animals of similar age and raised in the same environment. EBVs also take into account the genetic background of the animal (sires and dams).

A good example of this is an ultrasound measurement of Intra Muscular Fat (IMF). Ultrasound scanning technology has the ability to estimate the percentage of IMF in a live animal. This actual measurement does not account for the variations in nutritional background or age. Therefore an EBV for IMF% is a more accurate estimate of the genetic potential of an animal for marbling than a raw measurement on an individual animal.

Explanatory Notes for Horned Status of Animals

Please note that as per the Regulations of Herefords Australia Ltd.

"Description of Animals"

Polled, Horned, Scurred or H# animals shall be eligible for registration; and the letter P, H, S or H# shall be shown in the Company's records and on the Registration Certificate, as the recorded phenotype as provided by the breeder at the time of registration.

Any animal that has been DNA tested for Poll/Horn status and is found to be homozygous polled will automatically receive PP as a horn status:

(PP) – Homozygous Polled

(The animal has been DNA tested and the test result indicates that it is Homozygous Polled)

(P) – Polled

(H) – Horned

(S) – Scurred

(H#) – is a Horned animal either containing Polled genetics OR is missing a percentage of its four generation Horned pedigree

Any lots that have been tested for their Poll Gene Marker have their results printed in the catalogue. The results will show whether the bull is Homozygous (PP) or Heterozygous (PH) Polled.

A Homozygous Polled (PP) animal is a 'True Polled' animal and will only produce Polled (or Scurred) calves. They will not produce Horned calves.

A Heterozygous Polled (PH) animal carries a Polled and Horned gene and can produce Polled, Horned (or Scurred) calves.

SEMEN TESTS

All bulls in this catalogue have undergone a semen quality test within 70 days prior to date of sale.

Minimum requirement was 30% motile semen on day of test.

Semen test results are available for inspection upon request to the Duty Agent. There are a number of factors which may have affected semen quality since the date of these tests.

Neither Herefords Australia Limited nor the Show & Sale Committee warrant that the results of semen tests performed as a condition of entry to this sale are confirmation of semen quality on day of sale.

BREEDPLAN Explanatory Notes

Using BREEDPLAN Information to Purchase Superior Cattle

BREEDPLAN allows the objective measurement of beef cattle to be transformed into Estimated Breeding Values (EBVs). EBVs should be used in conjunction with other selection tools like bull breeding soundness exams and structural assessments. The methodology behind BREEDPLAN has been around since the 1950s and has been continuously developed since then. BREEDPLAN itself has been around for almost 40 years and is used by 100+ breed associations around the world. It is a proven technology with extensive scientific research and knowledge behind it.

How to Use EBVs to Select Animals

EBVs are expressed in the units of measurement for each particular trait. They are shown as positive or negative differences between an individual animal's genetics and the genetic base to which the animal is compared. For example, a bull with a 600 Day Weight EBV of +85 kg is 9 kg above a breed average of +76 kg. This means that his progeny would be expected, on average, to be 4.5 kg (9 kg ÷ 2 as half the genetics come from the cow) heavier at 600 days of age than the progeny of a breed average bull.

The breed average can also be found in the percentile table (Top 50% line). The percentile table can be used to evaluate where each animal ranks within the breed for each EBV trait (for example, two animals that are above breed average for a particular trait could be in the Top 5% and the Top 30% of the breed respectively). Percentile bands are available here: <https://abri.une.edu.au/online/cgi-bin/i4.dll?1=2A2C3E293E&2=2323&3=56&5=2B3C2B3C3A>.

Another useful tool is the EBV Percentile Graph. It is available online by bringing up an individual animal's page on the Hereford database. The EBV Percentile Graph shows which percentile band each animal is in for each trait. For most EBVs, it is desirable to have bars tending to the right-hand side of the graph, though there are exceptions (e.g. Mature Cow Weight) where moderate or the left-hand side of the graph may be preferable. The bars are also colour coded with calving traits being yellow, growth traits green, fertility traits red, carcass traits light blue, other traits dark blue and selection indexes pink.

When using EBVs to assist in selection decisions, it is important to place emphasis on those traits that are important to the particular markets and environment the bull is to be used in. Selection Indexes (described on the following pages) take the hard work out by balancing the combination of EBVs available.

EBVs Published By BREEDPLAN

Herefords Australia publishes BREEDPLAN EBVs for 19 traits, including birth, growth, fertility and carcass traits. The EBVs are described in more detail below.

Calving Ease Direct: The Calving Ease Direct EBV (%) describes genetic differences in the ability of a sire's calves to be born unassisted from 2 year old heifers. More positive EBVs are more favourable and indicate that 2 year old heifers will have less difficulty birthing the progeny of the bull.

Calving Ease Daughters: The Calving Ease Daughters EBV (%) describes genetic differences in the ability of a sire's 2 year old daughters to calve without assistance. More positive EBVs are more favourable and indicate easier calving of a sire's daughters at 2 years of age.

Gestation Length: The Gestation Length EBV (days) describes the genetic differences between animals in gestation length. Lower (negative) EBVs indicate shorter gestation length which is associated with lower birth weights and easier calving.

Birth Weight: The Birth Weight EBV (kg) describes genetic differences between animals in calf birth weight. Lower EBVs indicate lighter calves at birth and lower likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

200 Day Weight: The 200 Day Weight EBV (kg) describes genetic differences between animals in live weight at 200 days of age, with more positive EBVs indicating higher growth. This EBV is the best single estimate of an animal's genetic merit for early growth to weaning, and thus is an important trait for those who turn off animals as weaners.

400 Day Weight: The 400 Day Weight EBV (kg) describes genetic differences between animals in live weight at 400 days of age, with more positive EBVs indicating higher growth. This EBV is the best single estimate of an animal's genetic merit for yearling weight, and thus is an important trait for those who turn off animals as yearlings.

600 Day Weight: The 600 Day Weight EBV (kg) describes genetic differences between animals in live weight at 600 days of age, with more positive EBVs indicating higher growth. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age, and thus is important for those who target the production of animals suited for heavy weight grass or grain fed markets.

Mature Cow Weight: The Mature Cow Weight EBV (kg) describes genetic differences between cows in live weight at 5 years of age. More positive EBVs indicate heavier mature weights, which are associated with higher feed maintenance requirements.

Milk: The Milk EBV (kg) describes genetic differences in the maternal contribution of a dam to the 200 day weight of her calf. In the case of sires, the Milk EBV indicates the maternal contribution that his daughters will make to the 200 day weight of their progeny.

Scrotal Size: The Scrotal Size EBV (cm) describes genetic differences between animals in scrotal circumference at 400 days of age. More positive Scrotal Size EBVs are associated with increased semen quantity and quality in males, and earlier age at puberty in both males and females.

Days to Calving: The Days to Calving EBV (days) describes genetic differences between animals in the time from the start of the joining period (i.e. when the female is introduced to a bull) until subsequent calving. For sires, this EBV describes the fertility of his daughters. More negative EBVs indicate a shorter interval from bull-in date to calving and therefore higher fertility.

Carcase Weight: The Carcase Weight EBV (kg) describes genetic differences in hot standard carcase weight at 650 days of age, with more positive EBVs indicating higher carcase weight.

Eye Muscle Area: The Eye Muscle Area EBV (cm²) describes genetic differences in eye muscle area at the 12/13th rib site of a 300kg dressed carcase. More positive EBVs indicating better muscling.

Rib Fat: The Rib Fat EBV (mm) describes genetic differences in fat depth at the 12/13th rib site of a 300 kg dressed carcase. More positive EBVs indicate more subcutaneous fat and earlier maturity.

Rump Fat: The Rump Fat EBV (mm) describes genetic differences in fat depth at the P8 site of a 300 kg dressed carcase. More positive EBVs indicate more subcutaneous fat and earlier maturity.

Retail Beef Yield: The Retail Beef Yield EBV (%) describes genetic differences between animals for retail yield percentage in a 300 kg dressed carcase. Sires with larger EBVs are expected to produce progeny with higher yielding carcasses.

Intramuscular Fat: The Intramuscular Fat EBV (%) describes genetic difference in the percentage of intramuscular fat at the 12/13th rib site of a 300 kg dressed carcase. More positive EBVs indicate higher marbling.

Docility: The Docility EBV (%) describes genetic differences between animals in temperament. More positive EBVs indicate a higher proportion of progeny with favourable temperaments.

Net Feed Intake (Feedlot Finishing): The Net Feed Intake (Feedlot Finishing) EBV (kg) describes genetic differences between animals in feed intake at a standard weight and rate of weight gain when animals are in a feedlot finishing phase. More negative EBVs indicate progeny that eat less feed per day (when the progeny are of similar weight, are growing at a similar rate and are in a feedlot finishing phase).

EBV Accuracy

Percentage accuracies are presented with every EBV and give an indication of the amount of information that has been used in the calculation of that EBV. The higher the percentage accuracy, the lower the likelihood of change in the animal's EBV as more information is analysed for that animal or its relatives. In general, animals should be compared on EBVs regardless of accuracy. However, where two animals have similar EBVs, the animal with higher accuracy could be the safer choice, assuming all other factors (e.g. structure) are equal.

Remember, all information that is known about an animal and its relatives is considered in the calculation of its EBVs. Subsequently, the EBV will be the best estimate available of an animal's genetic merit, regardless of accuracy.

Hereford Selection Indexes

Ranking animals on their Selection Index value sorts them based on their progeny's expected profitability for the targeted production system. This takes the confusion out of looking at all of the EBVs and deciding how important each is to your farming system. Australian selection indexes rank animals based on their net profitability per cow joined.

There are currently four selection indexes calculated for Australian Hereford animals. These are:

- Southern Self-Replacing Index
- Northern Self-Replacing Index
- Southern Baldy Maternal Index
- Northern Baldy Terminal Index

Each selection index describes a different production/market scenario and relates to a typical commercial herd using Hereford bulls. Producers are advised to use the selection index that most closely aligns to their production system. All four selection indexes are focussed on maintaining and improving eating quality. Significant premiums are applied for increasing marble score up to a marble score of 3. Pressure is also applied to early life growth to maintain low ossification scores and good MSA compliance. In addition, each selection index targets the following specifications.

Southern Self-Replacing Index - Estimates the genetic differences between animals in net profitability per cow joined in a commercial self-replacing purebred Hereford herd targeting the domestic market. Daughters are retained for breeding and so maternal traits are of importance. Steers are slaughtered at 20 to 22 months of age to produce 300 kg carcasses with 10 mm P8 fat depth. A moderate cost is applied for cow feed costs during the annual feed shortage period which results in small increases in cow weight.

Northern Self-Replacing Index - Estimates the genetic differences between animals in net profitability per cow joined in a commercial self-replacing herd targeting the domestic market. This index is suitable for use by both straight bred Hereford herds and in crossbreeding programs where Hereford bulls are being used over a *Bos indicus* based cow herd (e.g. flatback). Daughters are retained for

BREEDPLAN Explanatory Notes *continued*

breeding and so maternal traits are of importance. Steers are slaughtered at 20 to 22 months of age to produce 340 kg carcasses with 12 mm P8 fat depth. A high cost is applied for cow feed costs during the annual feed shortage period which produces little change in mature cow weight.

Southern Baldy Maternal Index - Estimates the genetic differences between animals in net profitability per cow joined in a commercial crossbred herd using Hereford bulls over *Bos taurus* females (e.g. Angus). A portion of the heifers are retained for breeding and so maternal traits are of importance. The steers and surplus heifers are destined for slaughter at 20 to 22 months of age. Steers produce 300 kg carcasses with 10 mm of P8 fat depth, while heifers produce 270 kg carcasses with 12 mm of P8 fat depth. A moderate cost is applied for cow feed costs during the annual feed shortage period which results in small increases in cow weight.

Northern Baldy Terminal Index - Estimates the genetic differences between animals in net profitability per cow joined in a commercial crossbred herd (e.g. flatback) using Hereford bulls over *Bos indicus*/Tropical females (e.g. Santa Gertrudis) where all progeny (male and female) are destined for slaughter. Steers and heifers are slaughtered at 20 to 22 months of age. Steers produce 340 kg carcasses with 14 mm of P8 fat depth while heifers produce 300 kg carcasses with 17 mm of P8 fat depth.

Further information on the Hereford Selection Indexes, including a flow-chart to help you identify which selection index best suits your production system, is available on the Herefords Australia website here: <https://www.herefordsaustralia.com.au/2019/10/new-herefords-australia-selection-indexes-better-represent-modern-production-systems/>.

EBVs on sale cards displayed on sale day may vary from those published in this catalogue.

Hereford BREEDPLAN Data

1. Minimum Requirements

Bulls appearing in this catalogue are required to have current reportable Hereford BREEDPLAN EBVs for 200, 400 and 600 Day Weights, Fat Depth (Rib and Rump), Eye Muscle Area and Intramuscular Fat.

2. Traits Observed

The BREEDPLAN data for each lot in this catalogue carries a 'Traits Observed' indicator. This identifies those traits for which the animal has been directly measured and the animal's measurement included in the BREEDPLAN analysis. Where an animal has not been observed for a trait, the EBVs have been calculated from measurements on other related trait, the performance of the animal's relatives and/or genomic information of the animal's relatives.

SELECTION INDEX VALUES
